(Received 10th Dec 2018; accepted 21st Mar 2019)

Abstract. Mutualism is a fundamental relationship that can shape species communities through co-evolutionary adaptations and also has great ability to change ecosystem functions. Aphids and ants are common insect groups which are distributed widely across the world. The mutualistic relationships between them have gained much attention in history. However, very few studies have been carried out on the diversity of associated aphid and ant species pairs. In this study, we tried to gather available published data about the diversity of species pairs of aphids and ants to find out potential ecological and geographical patterns. The results showed that 284 species of aphids belonging to 83 genera and 9 subfamilies were mutualistically associated with 193 species of ants belonging to 38 genera and 4 subfamilies. In this report we elucidated a total of 972 aphid-ant interactions and 915 ant-aphid interactions (one aphid species may associate with many ant species and vice versa). Among these relationships, a highest number of ant species were associated with the aphid genus *Aphis*, while a highest number of aphids were associated with the ant genus *Formica*. Besides, an obvious geographical pattern was indicated that the subtropical region may have a higher diversity of aphid-ant associations. This global analysis of current knowledge about diversity and patterns of aphid-ant mutualistic relationships also indicates that more taxonomic and ecological studies are needed to enrich our understanding of these associations.

Keywords: *multispecies interaction, symbiosis, myrmecophiles, Hymenoptera, Formicidae*

Introduction

Reciprocally beneficial associations (e.g. mutualism) support and promote biodiversity (Herre et al., 1999; Bascompte and Jordano, 2007; Ito and Gobin, 2009). These interactions are common and conspicuous in terrestrial communities from tropical to temperate regions (Buckley, 1987; Hölldobler and Wilson, 1990; Delabie, 2001; Styrsky and Eubanks, 2007). These associations trigger the dynamics of ecological communities by influencing the environmental variables, species evolution and survival rate (Bronstein, 2009; Hosseini et al., 2017). One classic example of mutualistic relationship are the interactions between aphids and ants (Darwin, 1859; Stadler and Dixon, 2005).

The aphids (Hemiptera: Aphididae) are a group with 24 subfamilies and more than 5000 species all over the world (Favret, 2018). The diversity of aphid species is far higher in the northern hemisphere temperate regions than anywhere else (Dixon et al., 1987; Heie, 1994; Huang et al., 2012). Some aphid species are destructive pests and voracious feeder of various crops, and also vectors of various plants diseases (Mittler, 1958;

Blackman and Eastop, 1984; Buruchara et al., 2010). The ants (Hymenoptera: Formicidae) are one of the most common insect group on the Earth, which is divided into 21 subfamilies with 497 genera and more than 26700 species (Ward, 2013). Ants usually are very diverse and economically important social insects mostly dominant in the tropical regions (Hölldobler and Wilson, 1990; Philpott and Armbrecht, 2006). Ants fulfill their dietary requirements by performing various roles like decomposers, pollinators, scavengers, predators, and herbivores (Blackman and Eastop, 1984). Ants also feed on honeydew secretions of hemipterans such as aphids, and have a symbiotic association among them (Jahn and Beardsley, 1996; Styrsky and Eubanks, 2007).

Mutualism is a fundamental element in aphid-ant communities and behavior through co-evolutionary adaptation (Herre et al., 1999; Carabalí-Banguero et al., 2013). These relationships can abundantly be found within various aphid-ant groups (Styrsky and Eubanks, 2007) and can shape the species richness, abundance, and distribution. There are two main groups of aphids; myrmecophilous (tended by ants) and non-myrmecophilous (untended by ants) (Novgorodova, 2002, 2005). Myrmecophilous aphids and ants share their habitats and build a strong bond by providing food and security. Ants collect honeydew produced by aphids, and in return they protect them from their predators, parasitoids, and adverse climatic conditions (Hölldobler and Wilson, 1990; Stadler and Dixon, 2005; Novgorodova and Ryabinin, 2017). Moreover, ants provide aphids protection from the sooty mold infestation by sanitation, which propagates in the presences of honeydew accumulation (Way, 1963; Hölldobler and Wilson, 1990; Stadler and Dixon, 2005; Novgorodova and Ryabinin, 2017). For example, the population of associated aphids increased due to these relationships, and they can damage host plants and reduce yield. Honeydew-producing hemipterans tended by ants have a wide range of host plants, including trees, shrubs, vines (Floate and Whitham, 1994; Rico-Gray and Castro, 1996; Styrsky and Eubanks, 2007), fobs and grasses (Moya-Ragoza and Nault, 2000). Besides, the degree of such protection was observed to differ among aphids attending by ants (Addicott, 1978; Katayama and Suzuki, 2003; Novsgorodova and Gavrilyuk, 2012) and also depend on the aggressiveness of ants and honeydew collection approaches, in particular degree of specialty among foragers (Novgorodova and Gavrilyuk, 2012; Novgorodova, 2015). Due to the close aphid-ant interactions, complex networks of mutualistic interactions are formed between these insect groups of multispecies communities. The reason for their successful interaction is that they exist in a wide range of natural habitats (Buckley, 1987; Way and Khoo, 1992). However, ethological and ecological mechanisms of mutualism are still poorly understood.

The majority of previous studies have mainly focused on one or few pairs of aphid-ant species, while the general information of trophobiotic interactions among aphids and ants in most of regions are still limited. Besides, many review papers demonstrated the mutualistic ecology, cost and constraints, positive or negative mutualistic interactions of aphids and ants (Boucher et al., 1982; Buckley, 1987; Bronstein, 1994; Stadler and Dixon, 1998; Hoeksema and Bruna, 2000; Bronstein and Barbosa, 2002; Stadler and Dixon, 2005). However, there is a lack of the knowledge of diversity of aphid-ant species pairs which can provide complete information about their relationships in different ecological zones and can elaborate the patterns of these associations. A reason for this gap may be due to the lack of integration and meta-analysis of dispersed information on aphid-ant interactions in previous literature.

This study will generate an interest in quantifying the importance of aphid-ant interactions for global diversity patterns, distribution of species pairs and will also help

the examination of the interactions of aphid-ant species across different ecological zones. Furthermore, data on species pairs along with geographical information can be used to study aphid-ant interactions at regional and global scale. Therefore, there is a need to investigate the current state of knowledge about the diversity of aphid-ant species associations. Based on data from published literature, this paper aimed to depict the current state of the taxonomic diversity of aphid-ant species pairs as well as the spatial patterns of their interactions (Tylianakis et al., 2008; Gilman et al., 2010).

Materials and methods

Data collection of aphid-ant species pairs

We collected species and distribution data from the available previously published researches (1906 to 2016) on species pairs of mutualistic aphids and ants (*Table A1* in the *Appendix*). Literature searching was done by using tools including Web of Science, Google Scholar and Goolge. The data such as names of subfamilies, tribes, genera, and species as well as locations of aphids and associated ants were extracted from published researches. Many articles contained only species names and location, so for getting more details about their higher taxa the databases of Aphid Species File (<http://aphid.speciesfile.org>) and AntWeb (<https://www.antweb.org>) were used. These databases provide the complete taxonomic hierarchy of aphids and ants. The validation of species names was also rechecked based on these taxonomic databases. The Aphid Species File contained comprehensive information about aphids from all over the world and provided the taxonomic keys, taxa hierarchy, bibliographic data of aphids from all parts of the world. The AntWeb provides taxonomic keys, taxa hierarchy, specimen records, and natural history information and distribution maps on ants. Up till now, all types of biodiversity data of almost all species has been updated on these databases. The data in these two databases are freely accessible. Other information was fetched from the available published researches in different journals. Distribution localities for available species pairs along with geographical coordinates were compiled and arranged into a database (Microsoft Excel). Species localities were identified from the descriptions of previous literature. The accurate locality data points were collected according to the literature description, google earth and by using the website (www.findlatitudeandlongitude.com).

Geographical patterns of species associations

Latitudes and longitudes of species pairs were plotted on the outline of the World map with the help of Arc Map 10.2 (Geographical Information System, GIS) software. The ecological zones were selected by using the coordinates of temperate (35-66.5°), subtropical (23.5-35°) and tropical (0-23.5°) zones. The coordinates of temperate, subtropical and tropical regions were separated from primary data set. Separated data was plotted according to the coordinates of temperate, tropical and subtropical regions to find out the diversity of aphid-ant interactions in different regions.

Data analysis

Data analysis was conducted by using correlation test. For percentage of ant-associated aphids, non-parametric Spearman's test (two-tail) was used while for percentage of aphid-associated ants parametric Pearson test (two-tail) was used. To calculate the percentages

of genera and their species, the genera and species of each subfamily was divided by the total genera and species in all subfamilies. The fundamental statistical analysis has been applied to find out the diversity of species pairs in different regions of the world. The bar graphs were developed in Microsoft Excel by using extracted data.

Results

Taxonomic diversity

Aphid-associated ants

The percentage of all species numbers failed the normality test, so the non-parametric Spearman's test was used (two-tailed $P < 0.01$) for aphid associated ants. The results showed a positive correlation between the number of aphid species in relation with ant species ($t = 0.983$, $df = 8$, $P < 0.001$). Their patterns can be seen in (Table 1). Subfamily Aphidinae with about 59.85% of total aphid species was found associated with four subfamilies of ants (Table 1). Out of total 83 genera, the genus *Aphis* of subfamily Aphidinae was chiefly associated with 70.5% of ant species (Table 1).

Out of nine genera of subfamily Calaphidinae, genus *Symydobius* were associated with maximum number of ant species from four genera. Among the four genera of subfamily Chaitophorinae, about 81.25% species of the genus *Chaitophorus* were associated with 16 genera of ants. Out of 10 genera of the subfamily Eriosomatinae, the genus *Pemphigus* (only one species) was found supremely associated with 11 genera of ants. Among the eight genera of subfamily Lachninae, about 74.57% species of ants were interacting with the genus *Cinara*. In subfamily Drepanosiphinae the genus *Drepanaphis* having more interactions with ants. Genus *Thelaxes* received more ants than other genera under the subfamily Thelaxinae. For subfamilies Anoeciinae and Saltusaphidinae, only one genus from each was associated with ants (Table 1). Except subfamilies Thelaxinae and Saltusaphidinae, all genera from the other 7 subfamilies were mainly associated with species of ant genus *Formica*.

Table 1. The diversity of ant-associated aphids, with the numbers and percentages of aphid genera and species in each subfamily. The information of associated ants for each aphid group are also provided

Subfamily name	Aphid				Aphid-associated ant		
	Genus	Genus %	Species	Species %	Subfamily	Genus	Species
Anoeciinae	1	1.204	1	0.352	1	1	2
Aphidinae	46	55.421	170	59.859	4	37	161
Calaphidinae	9	10.843	12	4.225	2	6	15
Chaitophorinae	4	4.819	29	10.211	3	16	53
Drepanosiphinae	2	2.409	3	1.0563	2	3	6
Eriosomatinae	10	12.048	11	3.873	3	11	23
Lachninae	8	9.638	53	18.661	3	14	59
Thelaxinae	2	2.409	4	1.408	3	7	13
Saltusaphidinae	1	1.204	1	0.352	2	2	2
Total	83		284				

Ant-associated aphids

The data was found normal through the normality test, so the parametric Pearman's test was applied (two-tailed $P < 0.01$) for ant-associated aphids. The results showed a positive correlation between the numbers of aphid species and that of ant species ($t = 0.983$, $df = 3$, $P = 0.009$). The data presented graphically in *Table 2*. Out of four ant subfamilies, the Formicinae had maximum associations (66.84% of all) with all nine aphid subfamilies. The genus *Formica* was found highly associated with a maximum number of aphid species. Subfamily Myrmicinae contributes 29.53% of all associations with aphids, and out of the 16 genera associated with aphids, genus *Myrmica* tended maximum aphid species. Genus *Tapinoma* of subfamily Dolichoderinae found higher associations with aphids out of 6 other genera. Only genus *Tetraponera* of subfamily Pseudomyrmecinae interacted with only one species of ant (*Table 2*). Genus *Aphis* was found highly associated with almost all genera of all ant subfamilies.

Geographical diversity

Geographical diversity of species pairs varies in different geographical zones. *Figure 1* showed that the maximum aphid-ant species pairs were in the subtropical region. The ratios of species numbers of aphid to ant in these geographical zones were measured as 1.9:1 in the temperate, 1:2.8 in tropical while nearly equal associations with the ratio 1.1:1 in the subtropical region. In the temperate zone, eight subfamilies of aphids and three subfamilies of ants were associated. Only two aphid subfamilies and three ant subfamilies were associated in the tropical area. Higher associations were found in the subtropical region with eight aphid subfamilies and four ant subfamilies (*Table 3*). All collected information was extracted from 21 countries and the aphid-ant species pairs in each country were measured. In the current database, the USA contained a maximum number of species pairs in both temperate and subtropical zones. The second highest number of species pairs was recorded in Turkey (*Fig. 2*). However, equally associated species pairs were documented from subtropical areas of the world. Overall the patterns of aphid-ant interactions in different ecological zones can be seen in the *Figure 3*.

Discussion

Our data showed that among the 24 subfamilies of Aphididae (Favret, 2018), only nine are myrmecophilous (*Table 1*). The aphid subfamily Aphidinae has maximum number of associations with ant species, which corresponds well to the total species diversity of this aphid subfamily. Their maximum associations might be due to some ecological traits and population dynamics (Stadler and Dixon, 2005). A large variety of biological components have been projected to account for population-level variance in aphid-ant interactions including local species abundance and composition of aphids (Horvitz and Schemske, 1984). There are total 23 subfamilies of ants, but only six of them are associated with hemipteran insects (Styrsky and Eubanks, 2007). According to previous statistics, only the subfamilies Dolichoderinae, Formicinae and Myrmicinae harvest honeydew from aphids (Nixon, 1951; Stadler and Dixon, 2005). According to this study, four ant subfamilies, Dolichoderinae, Formicinae, Myrmicinae, and Pseudomyrmecinae (*Table 2*), are involved in aphid-ant interactions. Styrsky and Eubank (2007) indicated that 89% of ants from Formicinae and Myrmicinae involved in ant-hemipteran relationships. In the data we complied, it is observed that about 92% species of ants from Formicinae and Myrmicinae are associated with aphids. According to the Novgorodova and Gavrilyuk (2012) these subfamilies also have maximum trophobiotic interactions with aphids that have a significant effect on aphido-fauna. However, according to the results of this study few species of subfamilies Dolichoderinae and Pseudomyrmecinae were associated in trophobiotic relationships with aphid. The diversity of the mutualistic interaction of subfamily Formicinae might be due to their abundance and ecological dominance. Some subfamilies were less associated with aphids that might be due to less attention paid on these genera of ants.

Diversity and richness of aphid species was higher than ants in the temperate zone (Dixon et al., 1987; Clua et al., 2004), an aphid-ant species ratio of 1.2:1 indicated their abundance in this region (*Figure 1*). In the temperate region, one aphid species tended by many ant species such as the Novgorodova and Ryabinin (2017) documented that the aphid species *Symydobius oblongus*, *Chaitophorus populeti*, *Glyphina betulae*, *Aphis fabae*, *A. farinosa*, *A. urticata*, *Rhopalosiphum padi* were associated with 7 to 18 species of ants from temperate areas of Russia. In contrast, ants are exclusively abundant in the tropical zone (Hölldobler and Wilson, 1990; Sarnat et al., 2015). According to current study the aphid-ant species ratios in tropical areas were 1:2.8,

which indicated that the ants are more than half of the aphid species in these regions. For example, a tropical aphid *Cerataphis fransseni* attended by various species of ants (Stadler and Dixon, 2005) indicated the dominance of ants in the tropical region. On the other hand, the aphid-ant species ratio was 1.1:1 in subtropical region, which shows that the diversity of species pairs relatively higher in subtropical than the temperate and tropical regions (*Figure 1*). Most likely the aphids and ants might interact more in subtropical regions which have more favorable conditions for both groups.

The subtropical region consists of a typical warm humid climate with diverse vegetations (e.g. semi-evergreen or semi-deciduous forests, savannah, hardwood forests, pastures, warm temperate moist forests, semi-desert and nemoral deciduous forests) (Prentice et al., 1992; Webb, 2015), which supports the insect and plant biodiversity. Considering aphids are abundant in the temperate zone while ants are most diverse in the tropical, it is suggested that there should be more diverse aphid-ant associations because both groups can interact more in the subtropical zone located between temperate and tropical zones. Geographical species distribution patterns found linear on the borders of temperate and subtropics (*Figure 3*). There might be two possibilities, 1) the diversity of species pairs higher than other regions, and 2) the studies recorded aphid-ant interactions vastly carried out in these regions. However, the current data may also indicate the research on diversity of aphid-ant interactions is still inadequate, which causes an imbalance of information. Therefore, we suggest more future studies should be undertaken to record more associated species of aphids and ants and then we can understand more about their mutualistic relationships.

Conclusion

Based on a meta-analysis of currently available records of aphid-ant interactions, this study reports that 284 species belonging to the 83 genera of eight aphid subfamilies have mutualistic association with 193 species belonging to 38 genera of four subfamilies of ants. These species support a total of 972 aphid-ant interactions and 915 ant-aphid interactions (one aphid species may associate with many ant species and vice versa). The aphid genus *Aphis* has a highest number of associations with ant species while highest number of aphids are associated with the ant genus *Formica*. Geographically, maximum aphid-ant species pairs were found in subtropical areas of the world. Our results provide a base for identifying general patterns of aphid-ant species pairs in different ecological zones. Besides, more taxonomic and ecological studies are needed to enrich our understanding of the aphid-ant associations.

Acknowledgements. We would like to thank help from Dr. Jun Deng, Taimoor Hassan Farooq, Waqar Ahmed during this work. This work was supported by National Key R&D Program of China (2016YFE0203100) and Open Fund of Fujian Provincial Key Laboratory of Insect Ecology, Fujian Agriculture and Forestry University.

Author contribution. J.A.S., X. H. conceived and designed the study. J.A.S. performed all the formal analysis. J.L. performed the distribution mapping. J.A.S. and X.Z. collected and compiled the data. X.H. and I.B. reviewed and edited the manuscript.

Conflict of interests. Authors declared that there is no conflict of interests.

APPENDIX

Table A1. Species pairs of mutualistic aphids and ants

Aphid	Associated ant	Reference
Subfamily Aphidinae		
Tribe Aphidini		
<i>Aphis acetosae</i>	<i>Formica cunicularia</i>	Mortazavi et al. (2015)
<i>Aphis aiddletonii</i>	<i>Formica argentea</i>	Jones (1927)
	<i>Camponotus vicinus</i>	Jones (1927)
	<i>Formica argentea</i>	Jones (1927)
	<i>Formica aserva</i>	Addicott (1979a)
	<i>Formica canadensis</i>	Jones (1927)
	<i>Formica cinerea</i>	Jones (1927), Addicott (1979a)
	<i>Formica fusca</i>	Jones (1927), Addicott (1979a)
	<i>Formica integroides</i>	Addicott (1979a)
	<i>Formica lasioides</i>	Addicott (1979a)
	<i>Formica lepida</i>	Jones (1927)
	<i>Formica montana</i>	Jones (1927)
<i>Aphis asclepiadis</i>	<i>Formica neorufibarbis</i>	Addicott (1979a)
	<i>Formica obscuripes</i>	Addicott (1979a)
	<i>Formica opaciventris</i>	Jones (1927)
	<i>Formica podzolica</i>	Mooney and Agrawal (2008), Nielsen et al. (2009), Nielsen et al. (2009), Abdala-Roberts et al. (2012)
	<i>Myrmica incompleta</i>	Jones (1927)
	<i>Myrmica scabrinodis</i>	Jones (1927)
	<i>Myrmica whymperi</i>	Jones (1927)
	<i>Pheidole bicarinata</i>	Jones (1927)
	<i>Tapinoma sessile</i>	Jones (1927), Addicott (1979a)
<i>Aphis aurantii</i>	<i>Formica cinereofusca</i>	Akyildirim et al. (2014)

	<i>Lasius alienus</i>	Akyildirim et al. (2014)
	<i>Lasius turcicus</i>	Akyildirim et al. (2014)
	<i>Plagiolepis taurica</i>	Akyildirim et al. (2014)
<i>Aphis brassicae</i>	<i>Pheidole</i> sp.	Kataria and Kumar (2013)
	<i>Camponotus saxatilis</i>	Novgorodova (2005)
<i>Aphis brohmeri</i>	<i>Formica aquilonia</i>	Novgorodova (2005)
	<i>Formica polyctena</i>	Novgorodova (2005)
	<i>Camponotus aethiops</i>	Özdemir et al. (2008)
<i>Aphis brotericola</i>	<i>Camponotus piceus</i>	Özdemir et al. (2008)
	<i>Formica cunicularia</i>	Akyürek et al. (2016)
<i>Aphis brunellae</i>	<i>Lasius turcicus</i>	Akyürek et al. (2016)
<i>Aphis chloris</i>	<i>Camponotus piceus</i>	Özdemir et al. (2008)
<i>Aphis cinara</i>	<i>Formica lugubris</i>	Sudd (1983)
	<i>Camponotus vitreus</i>	Carver et al. (2003)
	<i>Iridomyrmex hartmeyeri</i>	Carver et al. (2003)
<i>Aphis clerodendri</i>	<i>Notoncus capitatus</i>	Carver et al. (2003)
	<i>Paratrechina vaga</i>	Carver et al. (2003)
	<i>Technomyrmex albipes</i>	Carver et al. (2003)
	<i>Crematogaster lineolata</i>	Favret et al. (2010)
	<i>Formica subsericea</i>	Favret et al. (2010)
<i>Aphis coreopsisidis</i>	<i>Linepithema humile</i>	Altfeld and Stiling (2009)
	<i>Paratrechina longicornis</i>	Favret et al. (2010)
	<i>Paratrechina parvula</i>	Favret et al. (2010)
<i>Aphis cornifoliae</i>	<i>Prenolepis imparis</i>	Favret et al. (2010)
<i>Aphis craccae</i>	<i>Lasius niger</i>	Novgorodova (2005)
	<i>Camponotus compressus</i>	Kataria and Kumar (2013), Rakhshan and Ahmad (2015)
	<i>Camponotus invidus</i>	Rakhshan and Ahmad (2015)
	<i>Camponotus kurdistanicus</i>	Stary (1969)
	<i>Camponotus libanicus</i>	Shiran et al. (2013)
	<i>Camponotus oasium</i>	Shiran et al. (2013)
	<i>Camponotus piceus</i>	Özdemir et al. (2008)
	<i>Cataglyphis aenescens</i>	Özdemir et al. (2008)
	<i>Crematogaster antaris</i>	Shiran et al. (2013)
	<i>Crematogaster inermis</i>	Mortazavi et al. (2015)
<i>Aphis craccivora</i>	<i>Crematogaster schmidti</i>	Mortazavi et al. (2015)
	<i>Crematogaster subdentata</i>	Mortazavi et al. (2015)
	<i>Formica aquilonia</i>	Novgorodova (2005)
	<i>Formica cinereofusca</i>	Akyildirim et al. (2014)
	<i>Formica cunicularia</i>	Özdemir et al. (2008), Mortazavi et al. (2015)
	<i>Formica fusca</i>	Akyürek et al. (2016)
	<i>Formica glauca</i>	Özdemir et al. (2008)
	<i>Formica polyctena</i>	Novgorodova (2005)
	<i>Formica pratensis</i>	Novgorodova (2005)
	<i>Lasius brunneus</i>	Akyürek et al. (2016)

	<i>Lasius japonicus</i>	Suzuki (2004), Katayama et al. (2013)
	<i>Lasius niger</i>	Novgorodova (2005), Kataria and Kumar (2013)
	<i>Lasius paralienus</i>	Özdemir et al. (2008), Shiran et al. (2013)
	<i>Lasius turcicus</i>	Akyildirim et al. (2014), Mortazavi et al. (2015)
	<i>Lepisiota bipartite</i>	Shiran et al. (2013)
	<i>Lepisiota frauenfeldi</i>	Rakhshan and Ahmad (2015)
	<i>Meranoplus bicolor</i>	Rakhshan and Ahmad (2015)
	<i>Monomorium destructor</i>	Shiran et al. (2013)
	<i>Monomorium latinode</i>	Rakhshan and Ahmad (2015)
	<i>Monomorium mayri</i>	Shiran et al. (2013)
	<i>Monomorium minimum</i>	Kataria and Kumar (2013)
	<i>Monomorium nitidiventre</i>	Mortazavi et al. (2015)
	<i>Monomorium pharaonis</i>	Rakhshan and Ahmad (2015)
	<i>Nylanderia fulva</i>	Sharma and Buss (2013)
	<i>Paratrechina longicornis</i>	Shiran et al. (2013), Rakhshan and Ahmad (2015)
	<i>Pheidole teneriffana</i>	Shiran et al. (2013)
	<i>Plagiolepis pallescens</i>	Özdemir et al. (2008), Shiran et al. (2013)
	<i>Plagiolepis pygmaea</i>	Mortazavi et al. (2015)
	<i>Polyrhachis hauxwelli</i>	Rakhshan and Ahmad (2015)
	<i>Polyrhachis lacteipennis</i>	Shiran et al. (2013)
	<i>Pristomyrmex punctatus</i>	Katayama et al. (2013)
	<i>Tapinoma erraticum</i>	Mortazavi et al. (2015)
	<i>Tapinoma simrothi</i>	Stary (1969), Shiran et al. (2013)
	<i>Tetramorium chefteki</i>	Özdemir et al. (2008), Mortazavi et al. (2015)
	<i>Tetramorium forte</i>	Özdemir et al. (2008)
	<i>Tetramorium tsushimae</i>	Suzuki (2004), Katayama et al. (2013), Hayashi et al. (2015), Hayashi et al. (2016)
	<i>Tetraponera rufonigra</i>	Rakhshan and Ahmad (2015)
<i>Aphis davletshinae</i>	<i>Pheidole pallidula</i>	Shiran et al. (2013)
	<i>Tapinoma simrothi</i>	Shiran et al. (2013)
<i>Aphis esulae</i>	<i>Formica fusca</i>	Akyürek et al. (2016)
<i>Aphis euphorbiae</i>	<i>Camponotus piceus</i>	Özdemir et al. (2008)
<i>Aphis evonymi</i>	<i>Formica aquilonia</i>	Novgorodova (2005)
	<i>Formica polyctena</i>	Novgorodova (2005)
<i>Aphis fabae</i>	<i>Camponotus aethiops</i>	Akyürek et al. (2016)
	<i>Camponotus compressus</i>	Kataria and Kumar (2013)
	<i>Camponotus piceus</i>	Özdemir et al. (2008)
	<i>Camponotus saxatilis</i>	Novgorodova (2005)
	<i>Cataglyphis lividus</i>	Shiran et al. (2013)
	<i>Cremastogaster scutellaris</i>	Akyürek et al. (2016)
	<i>Crematogaster lineolata</i>	Favret et al. (2010)
	<i>Formica aquilonia</i>	Novgorodova (2005)
	<i>Formica cinereofusca</i>	Akyildirim et al. (2014)

	<i>Formica cunicularia</i>	Akyürek et al. (2016)
	<i>Formica fusca</i>	Akyildirim et al. (2014)
	<i>Formica polyctena</i>	Novgorodova (2005)
	<i>Lasius alienus</i>	Akyildirim et al. (2014), Akyürek et al. (2016)
	<i>Lasius brunneus</i>	Akyürek et al. (2016)
	<i>Lasius emarginatus</i>	Akyildirim et al. (2014)
	<i>Lasius niger</i>	Liepert and Dettner (1993), Volkl et al. (1999), Offenberg (2001), Woodring et al. (2004), Fischer et al. (2005), Detrain et al. (2010), Sanders et al. (2010), Tegelaar et al. (2012), Tegelaar et al. (2013), Fischer et al. (2015), Tegelaar (2015), Vautaux et al. (2015)
	<i>Lasius paralienus</i>	Özdemir et al. (2008), Shiran et al. (2013)
	<i>Lasius turcicus</i>	Akyildirim et al. (2014), Akyürek et al. (2016)
	<i>Lepisiota bipartite</i>	Shiran et al. (2013)
	<i>Lepisiota nigra</i>	Mortazavi et al. (2015)
	<i>Monomorium libanicum</i>	Shiran et al. (2013)
	<i>Monomorium mayri</i>	Shiran et al. (2013)
	<i>Monomorium minimum</i>	Kataria and Kumar (2013)
	<i>Monomorium qarahe</i>	Shiran et al. (2013)
	<i>Myrmica ruginodis</i>	Akyildirim et al. (2014)
	<i>Plagiolepis pallidescens</i>	Shiran et al. (2013)
	<i>Plagiolepis pygmaea</i>	Akyürek et al. (2016)
	<i>Prenolepis imparis</i>	Favret et al. (2010)
	<i>Tapinoma erraticum</i>	Mortazavi et al. (2015)
	<i>Tapinoma simrothi</i>	Stary (1969), Shiran et al. (2013)
	<i>Tetramorium caespitum</i>	Shiran et al. (2013), Akyildirim et al. (2014)
	<i>Tetramorium tsushimae</i>	Hayashi et al. (2015)
	<i>Formica glauca</i>	Özdemir et al. (2008)
<i>Aphis farinosa</i>	<i>Crematogaster antarialis</i>	Shiran et al. (2013)
	<i>Formica cinereofusca</i>	Akyildirim et al. (2014)
	<i>Formica fusca</i>	Jones (1927)
	<i>Formica gagates</i>	Akyildirim et al. (2014)
	<i>Formica integroides</i>	Addicott (1978)
	<i>Lasius turcicus</i>	Akyildirim et al. (2014)
	<i>Myrmica whymperi</i>	Jones (1927)
